

Every trapped root at 20 Hz, model 'lid_over_channel' (400 / 180 / 600 m/s) — numbers are mode indices

Both codes find the same root VALUES. disba spends two mode slots on one root (red), which shifts every index above it by one — and its list runs out before ours, so the top roots have no counterpart.

this code

disba 0.7.0

one root,
two mode slots

one root,
two mode slots

Rayleigh phase velocity (m/s)
